## Flashcard Supplement to A First Course in Linear Algebra

Robert A. Beezer

University of Puget Sound

Version 3.00-preview(October 21, 2013)

Robert A. Beezer is a Professor of Mathematics at the University of Puget Sound, where he has been on the faculty since 1984. He received a B.S. in Mathematics (with an Emphasis in Computer Science) from the University of Santa Clara in 1978, a M.S. in Statistics from the University of Illinois at Urbana-Champaign in 1982 and a Ph.D. in Mathematics from the University of Illinois at Urbana-Champaign in 1984.

In addition to his teaching at the University of Puget Sound, he has made sabbatical visits to the University of the West Indies (Trinidad campus) and the University of Western Australia. He has also given several courses in the Master's program at the African Institute for Mathematical Sciences, South Africa. He has been a Sage developer since 2008.

He teaches calculus, linear algebra and abstract algebra regularly, while his research interests include the applications of linear algebra to graph theory. His professional website is at http://buzzard.ups.edu.

**Definition SLE** System of Linear Equations 1 A system of linear equations is a collection of m equations in the variable quantities  $x_1, x_2, x_3, \ldots, x_n$  of the form,

> $a_{11}x_1 + a_{12}x_2 + a_{13}x_3 + \dots + a_{1n}x_n = b_1$   $a_{21}x_1 + a_{22}x_2 + a_{23}x_3 + \dots + a_{2n}x_n = b_2$   $a_{31}x_1 + a_{32}x_2 + a_{33}x_3 + \dots + a_{3n}x_n = b_3$   $\vdots$  $a_{m1}x_1 + a_{m2}x_2 + a_{m3}x_3 + \dots + a_{mn}x_n = b_m$

where the values of  $a_{ij}$ ,  $b_i$  and  $x_j$ ,  $1 \le i \le m$ ,  $1 \le j \le n$ , are from the set of complex numbers,  $\mathbb{C}$ .

 $\mathbf{2}$ 

#### Definition SSLE Solution of a System of Linear Equations

A solution of a system of linear equations in n variables,  $x_1, x_2, x_3, \ldots, x_n$  (such as the system given in Definition SLE), is an ordered list of n complex numbers,  $s_1, s_2, s_3, \ldots, s_n$  such that if we substitute  $s_1$  for  $x_1, s_2$  for  $x_2, s_3$  for  $x_3, \ldots, s_n$  for  $x_n$ , then for every equation of the system the left side will equal the right side, i.e. each equation is true simultaneously.

Definition SSSLE Solution Set of a System of Linear Equations 3
The solution set of a linear system of equations is the set which contains every solution to the
system, and nothing more.

 $\textcircled{O}2004 \mbox{---}2013$ Robert A. Beezer, GFDL License

 $\mathbf{4}$ 

Definition ESYS	Equivalent Systems
Two systems of lines	r equations are equivalent if their solution sets are equal.

#### Definition EO Equation Operations

Given a system of linear equations, the following three operations will transform the system into a different one, and each operation is known as an equation operation.

- 1. Swap the locations of two equations in the list of equations.
- 2. Multiply each term of an equation by a nonzero quantity.
- 3. Multiply each term of one equation by some quantity, and add these terms to a second equation, on both sides of the equality. Leave the first equation the same after this operation, but replace the second equation by the new one.

©2004—2013 Robert A. Beezer, GFDL License

#### Theorem EOPSS Equation Operations Preserve Solution Sets

If we apply one of the three equation operations of Definition EO to a system of linear equations (Definition SLE), then the original system and the transformed system are equivalent.

6

#### Definition M Matrix

An  $m \times n$  matrix is a rectangular layout of numbers from  $\mathbb{C}$  having m rows and n columns. We will use upper-case Latin letters from the start of the alphabet (A, B, C, ...) to denote matrices and squared-off brackets to delimit the layout. Many use large parentheses instead of brackets — the distinction is not important. Rows of a matrix will be referenced starting at the top and working down (i.e. row 1 is at the top) and columns will be referenced starting from the left (i.e. column 1 is at the left). For a matrix A, the notation  $[A]_{ij}$  will refer to the complex number in row i and column j of A.

©2004—2013 Robert A. Beezer, GFDL License

#### Definition CV Column Vector

A column vector of size m is an ordered list of m numbers, which is written in order vertically, starting at the top and proceeding to the bottom. At times, we will refer to a column vector as simply a vector. Column vectors will be written in bold, usually with lower case Latin letter from the end of the alphabet such as  $\mathbf{u}, \mathbf{v}, \mathbf{w}, \mathbf{x}, \mathbf{y}, \mathbf{z}$ . Some books like to write vectors with arrows, such as  $\vec{u}$ . Writing by hand, some like to put arrows on top of the symbol, or a tilde underneath the symbol, as in u. To refer to the entry or component of vector  $\mathbf{v}$  in location i of the list, we write  $[\mathbf{v}]_i$ .

8

 $\mathbf{7}$ 

**Definition ZCV** Zero Column Vector The zero vector of size *m* is the column vector of size *m* where each entry is the number zero,

$$\mathbf{0} = \begin{bmatrix} 0\\0\\0\\\vdots\\0 \end{bmatrix}$$

or defined much more compactly,  $[\mathbf{0}]_i = 0$  for  $1 \le i \le m$ .

 $\mathbf{11}$ 

12

#### Definition MRLS Matrix Representation of a Linear System

If A is the coefficient matrix of a system of linear equations and **b** is the vector of constants, then we will write  $\mathcal{LS}(A, \mathbf{b})$  as a shorthand expression for the system of linear equations, which we will refer to as the matrix representation of the linear system.

©2004—2013 Robert A. Beezer, GFDL License

#### Definition AM Augmented Matrix

Suppose we have a system of m equations in n variables, with coefficient matrix A and vector of constants **b**. Then the augmented matrix of the system of equations is the  $m \times (n + 1)$  matrix whose first n columns are the columns of A and whose last column (n + 1) is the column vector **b**. This matrix will be written as  $[A \mid \mathbf{b}]$ .

**14** c of

 $\mathbf{13}$ 

#### Definition RO Row Operations

The following three operations will transform an  $m \times n$  matrix into a different matrix of the same size, and each is known as a row operation.

- 1. Swap the locations of two rows.
- 2. Multiply each entry of a single row by a nonzero quantity.
- 3. Multiply each entry of one row by some quantity, and add these values to the entries in the same columns of a second row. Leave the first row the same after this operation, but replace the second row by the new values.

We will use a symbolic shorthand to describe these row operations:

- 1.  $R_i \leftrightarrow R_j$ : Swap the location of rows *i* and *j*.
- 2.  $\alpha R_i$ : Multiply row *i* by the nonzero scalar  $\alpha$ .
- 3.  $\alpha R_i + R_j$ : Multiply row *i* by the scalar  $\alpha$  and add to row *j*.

©2004—2013 Robert A. Beezer, GFDL License

#### Definition REM Row-Equivalent Matrices

Two matrices, A and B, are row-equivalent if one can be obtained from the other by a sequence of row operations.

©2004—2013 Robert A. Beezer, GFDL License

15

16

**Theorem REMES** Row-Equivalent Matrices represent Equivalent Systems 17 Suppose that A and B are row-equivalent augmented matrices. Then the systems of linear equations that they represent are equivalent systems.

©2004—2013 Robert A. Beezer, GFDL License

18

#### Definition RREF Reduced Row-Echelon Form

A matrix is in reduced row-echelon form if it meets all of the following conditions:

- 1. If there is a row where every entry is zero, then this row lies below any other row that contains a nonzero entry.
- 2. The leftmost nonzero entry of a row is equal to 1.
- 3. The leftmost nonzero entry of a row is the only nonzero entry in its column.
- 4. Consider any two different leftmost nonzero entries, one located in row i, column j and the other located in row s, column t. If s > i, then t > j.

A row of only zero entries is called a zero row and the leftmost nonzero entry of a nonzero row is a leading 1. A column containing a leading 1 will be called a pivot column. The number of nonzero rows will be denoted by r, which is also equal to the number of leading 1's and the number of pivot columns.

The set of column indices for the pivot columns will be denoted by  $D = \{d_1, d_2, d_3, \ldots, d_r\}$ where  $d_1 < d_2 < d_3 < \cdots < d_r$ , while the columns that are not pivot columns will be denoted as  $F = \{f_1, f_2, f_3, \ldots, f_{n-r}\}$  where  $f_1 < f_2 < f_3 < \cdots < f_{n-r}$ .

<b>Theorem REMEF</b> Row-Equivalent Matrix in Echelon FormSuppose $A$ is a matrix. Then there is a matrix $B$ so that
1. $A$ and $B$ are row-equivalent.
2. $B$ is in reduced row-echelon form.

©2004—2013 Robert A. Beezer, GFDL License

#### Theorem RREFU Reduced Row-Echelon Form is Unique

Suppose that A is an  $m \times n$  matrix and that B and C are  $m \times n$  matrices that are row-equivalent to A and in reduced row-echelon form. Then B = C.

19

 $\mathbf{20}$ 

Definition CS Consistent System 21 A system of linear equations is consistent if it has at least one solution. Otherwise, the system is called inconsistent.

©2004—2013 Robert A. Beezer, GFDL License

 $\mathbf{22}$ 

#### Definition IDV Independent and Dependent Variables

Suppose A is the augmented matrix of a consistent system of linear equations and B is a rowequivalent matrix in reduced row-echelon form. Suppose j is the index of a pivot column of B. Then the variable  $x_j$  is dependent. A variable that is not dependent is called independent or free.

#### Theorem RCLS Recognizing Consistency of a Linear System

Suppose A is the augmented matrix of a system of linear equations with n variables. Suppose also that B is a row-equivalent matrix in reduced row-echelon form with r nonzero rows. Then the system of equations is inconsistent if and only if column n + 1 of B is a pivot column.

©2004—2013 Robert A. Beezer, GFDL License

#### **Theorem CSRN** Consistent Systems, r and n

Suppose A is the augmented matrix of a consistent system of linear equations with n variables. Suppose also that B is a row-equivalent matrix in reduced row-echelon form with r pivot columns. Then  $r \leq n$ . If r = n, then the system has a unique solution, and if r < n, then the system has infinitely many solutions.

 $\mathbf{23}$ 

 $\mathbf{24}$ 

#### Theorem FVCS Free Variables for Consistent Systems

Suppose A is the augmented matrix of a consistent system of linear equations with n variables. Suppose also that B is a row-equivalent matrix in reduced row-echelon form with r rows that are not completely zeros. Then the solution set can be described with n - r free variables.

©2004—2013 Robert A. Beezer, GFDL License

Theorem PSSLSPossible Solution Sets for Linear SystemsA system of linear equations has no solutions, a unique solution or infinitely many solutions	<b>26</b>

©2004—2013 Robert A. Beezer, GFDL License

 $\mathbf{25}$ 

**Theorem CMVEI** Consistent, More Variables than Equations, Infinite solutions27 Suppose a consistent system of linear equations has m equations in n variables. If n > m, then the system has infinitely many solutions.

 $\textcircled{0}2004\mbox{---}2013$ Robert A. Beezer, GFDL License

**Definition HS** Homogeneous System 28 A system of linear equations,  $\mathcal{LS}(A, \mathbf{b})$  is homogeneous if the vector of constants is the zero vector, in other words, if  $\mathbf{b} = \mathbf{0}$ .

Theorem HSC Homogeneous Systems are Consistent	<b>29</b>
Suppose that a system of linear equations is homogeneous. Then the system is consistent	and
one solution is found by setting each variable to zero.	

©2004—2013 Robert A. Beezer, GFDL License

**Definition TSHSE** Trivial Solution to Homogeneous Systems of Equations 30 Suppose a homogeneous system of linear equations has *n* variables. The solution  $x_1 = 0$ ,  $x_2 = 0$ , ,  $x_n = 0$  (i.e.  $\mathbf{x} = \mathbf{0}$ ) is called the trivial solution.

Theorem HMVEI Homogeneous, More Variables than Equations, Infinite solutions 31

Suppose that a homogeneous system of linear equations has m equations and n variables with n > m. Then the system has infinitely many solutions.

©2004—2013 Robert A. Beezer, GFDL License

### **Definition NSM** Null Space of a Matrix 32 The null space of a matrix A, denoted $\mathcal{N}(A)$ , is the set of all the vectors that are solutions to the homogeneous system $\mathcal{LS}(A, \mathbf{0})$ .

 $\textcircled{O}2004{--}2013$ Robert A. Beezer, GFDL License

#### **Definition SQM** Square Matrix 33 A matrix with m rows and n columns is square if m = n. In this case, we say the matrix has size n. To emphasize the situation when a matrix is not square, we will call it rectangular.

©2004—2013 Robert A. Beezer, GFDL License

#### Definition NM Nonsingular Matrix

Suppose A is a square matrix. Suppose further that the solution set to the homogeneous linear system of equations  $\mathcal{LS}(A, \mathbf{0})$  is  $\{\mathbf{0}\}$ , in other words, the system has only the trivial solution. Then we say that A is a nonsingular matrix. Otherwise we say A is a singular matrix.

©2004—2013 Robert A. Beezer, GFDL License

34

**Definition IM** Identity Matrix The  $m \times m$  identity matrix,  $I_m$ , is defined by

$$\left[I_m\right]_{ij} = \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases} \qquad 1 \le i, \, j \le m$$

©2004—2013 Robert A. Beezer, GFDL License

Theorem NMRRI Nonsingular Matrices Row Reduce to the Identity matrix 36 Suppose that A is a square matrix and B is a row-equivalent matrix in reduced row-echelon form. Then A is nonsingular if and only if B is the identity matrix.

 $\textcircled{O}2004{--}2013$ Robert A. Beezer, GFDL License

 $\mathbf{35}$ 

Theorem NMTNS Nonsingular Matrices have Trivial Null Spaces	<b>37</b>
Suppose that $A$ is a square matrix. Then $A$ is nonsingular if and only if the null space of $A$	A is
the set containing only the zero vector, i.e. $\mathcal{N}(A) = \{0\}.$	

©2004—2013 Robert A. Beezer, GFDL License

Theorem NMUS	Nonsingular Matrices and Unique Solutions	38
Suppose that $A$ is a s	square matrix. A is a nonsingular matrix if and only if the system $\mathcal{L}$	$\mathcal{S}(A, \mathbf{b})$
has a unique solution	n for every choice of the constant vector $\mathbf{b}$ .	

 $\textcircled{O}2004{--}2013$ Robert A. Beezer, GFDL License

<b>Theorem NME1</b> Nonsingular Matrix Equivalences, Round 1Suppose that $A$ is a square matrix. The following are equivalent.
1. A is nonsingular.
2. A row-reduces to the identity matrix.
3. The null space of A contains only the zero vector, $\mathcal{N}(A) = \{0\}.$
4. The linear system $\mathcal{LS}(A, \mathbf{b})$ has a unique solution for every possible choice of $\mathbf{b}$ .

**39** 

Definition VSCV	Vector Space of Column Vectors	40
The vector space $\mathbb{C}^m$	is the set of all column vectors (Definition CV	) of size $m$ with entries from
the set of complex nu	mbers, $\mathbb{C}$ .	

**Definition CVE** Column Vector Equality 41 Suppose that  $\mathbf{u}, \mathbf{v} \in \mathbb{C}^m$ . Then  $\mathbf{u}$  and  $\mathbf{v}$  are equal, written  $\mathbf{u} = \mathbf{v}$  if  $[\mathbf{u}]_i = [\mathbf{v}]_i$   $1 \le i \le m$ 

 $\textcircled{O}2004\mbox{---}2013$ Robert A. Beezer, GFDL License

**Definition CVSM** Column Vector Scalar Multiplication 43 Suppose  $\mathbf{u} \in \mathbb{C}^m$  and  $\alpha \in \mathbb{C}$ , then the scalar multiple of  $\mathbf{u}$  by  $\alpha$  is the vector  $\alpha \mathbf{u}$  defined by  $[\alpha \mathbf{u}]_i = \alpha [\mathbf{u}]_i$   $1 \le i \le m$ 

©2004—2013 Robert A. Beezer, GFDL License

# **Theorem VSPCVVector Space Properties of Column Vectors**44Suppose that $\mathbb{C}^m$ is the set of column vectors of size m (Definition VSCV) with addition and<br/>scalar multiplication as defined in Definition CVA and Definition CVSM. Then44• ACC Additive Closure, Column Vectors: If $\mathbf{u}, \mathbf{v} \in \mathbb{C}^m$ , then $\mathbf{u} + \mathbf{v} \in \mathbb{C}^m$ .

- SCC Scalar Closure, Column Vectors: If  $\alpha \in \mathbb{C}$  and  $\mathbf{u} \in \mathbb{C}^m$ , then  $\alpha \mathbf{u} \in \mathbb{C}^m$ .
- CC Commutativity, Column Vectors: If  $\mathbf{u}, \mathbf{v} \in \mathbb{C}^m$ , then  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$ .
- AAC Additive Associativity, Column Vectors: If  $\mathbf{u}, \mathbf{v}, \mathbf{w} \in \mathbb{C}^m$ , then  $\mathbf{u} + (\mathbf{v} + \mathbf{w}) = (\mathbf{u} + \mathbf{v}) + \mathbf{w}$ .
- ZC Zero Vector, Column Vectors: There is a vector,  $\mathbf{0}$ , called the zero vector, such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$  for all  $\mathbf{u} \in \mathbb{C}^m$ .
- AIC Additive Inverses, Column Vectors: If  $\mathbf{u} \in \mathbb{C}^m$ , then there exists a vector  $-\mathbf{u} \in \mathbb{C}^m$  so that  $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$ .
- SMAC Scalar Multiplication Associativity, Column Vectors: If  $\alpha$ ,  $\beta \in \mathbb{C}$  and  $\mathbf{u} \in \mathbb{C}^m$ , then  $\alpha(\beta \mathbf{u}) = (\alpha \beta) \mathbf{u}$ .
- DVAC Distributivity across Vector Addition, Column Vectors: If  $\alpha \in \mathbb{C}$  and  $\mathbf{u}, \mathbf{v} \in \mathbb{C}^m$ , then  $\alpha(\mathbf{u} + \mathbf{v}) = \alpha \mathbf{u} + \alpha \mathbf{v}$ .
- DSAC Distributivity across Scalar Addition, Column Vectors: If  $\alpha, \beta \in \mathbb{C}$  and  $\mathbf{u} \in \mathbb{C}^m$ , then  $(\alpha + \beta)\mathbf{u} = \alpha \mathbf{u} + \beta \mathbf{u}$ .
- OC One, Column Vectors: If  $\mathbf{u} \in \mathbb{C}^m$ , then  $1\mathbf{u} = \mathbf{u}$ .

 Definition LCCV
 Linear Combination of Column Vectors
 45

 Given n vectors  $\mathbf{u}_1$ ,  $\mathbf{u}_2$ ,  $\mathbf{u}_3$ , ...,  $\mathbf{u}_n$  from  $\mathbb{C}^m$  and n scalars  $\alpha_1$ ,  $\alpha_2$ ,  $\alpha_3$ , ...,  $\alpha_n$ , their linear combination is the vector

  $\alpha_1 \mathbf{u}_1 + \alpha_2 \mathbf{u}_2 + \alpha_3 \mathbf{u}_3 + \dots + \alpha_n \mathbf{u}_n$ 

©2004—2013 Robert A. Beezer, GFDL License

**Theorem SLSLC** Solutions to Linear Systems are Linear Combinations 46 Denote the columns of the  $m \times n$  matrix A as the vectors  $\mathbf{A}_1, \mathbf{A}_2, \mathbf{A}_3, \ldots, \mathbf{A}_n$ . Then  $\mathbf{x} \in \mathbb{C}^n$  is a solution to the linear system of equations  $\mathcal{LS}(A, \mathbf{b})$  if and only if  $\mathbf{b}$  equals the linear combination of the columns of A formed with the entries of  $\mathbf{x}$ ,

 $[\mathbf{x}]_1 \mathbf{A}_1 + [\mathbf{x}]_2 \mathbf{A}_2 + [\mathbf{x}]_3 \mathbf{A}_3 + \dots + [\mathbf{x}]_n \mathbf{A}_n = \mathbf{b}$ 

#### Theorem VFSLS Vector Form of Solutions to Linear Systems

Suppose that  $[A \mid \mathbf{b}]$  is the augmented matrix for a consistent linear system  $\mathcal{LS}(A, \mathbf{b})$  of m equations in n variables. Let B be a row-equivalent  $m \times (n+1)$  matrix in reduced row-echelon form. Suppose that B has r pivot columns, with indices  $D = \{d_1, d_2, d_3, \ldots, d_r\}$ , while the n-r non-pivot columns have indices in  $F = \{f_1, f_2, f_3, \ldots, f_{n-r}, n+1\}$ . Define vectors  $\mathbf{c}, \mathbf{u}_j, 1 \leq j \leq n-r$  of size n by

$$\begin{split} \left[\mathbf{c}\right]_i &= \begin{cases} 0 & \text{if } i \in F \\ \left[B\right]_{k,n+1} & \text{if } i \in D, \, i = d_k \end{cases} \\ \left[\mathbf{u}_j\right]_i &= \begin{cases} 1 & \text{if } i \in F, \, i = f_j \\ 0 & \text{if } i \in F, \, i \neq f_j \\ -\left[B\right]_{k,f_i} & \text{if } i \in D, \, i = d_k \end{cases} \end{split}$$

Then the set of solutions to the system of equations  $\mathcal{LS}(A, \mathbf{b})$  is

$$S = \{ \mathbf{c} + \alpha_1 \mathbf{u}_1 + \alpha_2 \mathbf{u}_2 + \alpha_3 \mathbf{u}_3 + \dots + \alpha_{n-r} \mathbf{u}_{n-r} | \alpha_1, \alpha_2, \alpha_3, \dots, \alpha_{n-r} \in \mathbb{C} \}$$

#### Definition LICV Linear Independence of Column Vectors

The set of vectors  $S = {\mathbf{u}_1, \mathbf{u}_2, \mathbf{u}_3, \dots, \mathbf{u}_n}$  is linearly dependent if there is a relation of linear dependence on S that is not trivial. In the case where the only relation of linear dependence on S is the trivial one, then S is a linearly independent set of vectors.

#### Definition EEF Extended Echelon Form

142Suppose A is an  $m \times n$  matrix. Extend A on its right side with the addition of an  $m \times m$ identity matrix to form an  $m \times (n+m)$  matrix M. Use row operations to bring M to reduced row-echelon form and call the result N. N is the extended reduced row-echelon form of A, and we will standardize on names for five submatrices (B, C, J, K, L) of N.

Let B denote the  $m \times n$  matrix formed from the first n columns of N and let J denote the  $m \times m$ matrix formed from the last m columns of N. Suppose that B has r nonzero rows. Further partition N by letting C denote the  $r \times n$  matrix formed from all of the nonzero rows of B. Let K be the  $r \times m$  matrix formed from the first r rows of J, while L will be the  $(m-r) \times m$  matrix formed from the bottom m - r rows of J. Pictorially,

$$M = [A|I_m] \xrightarrow{\text{RREF}} N = [B|J] = \begin{bmatrix} C & K \\ \hline 0 & L \end{bmatrix}$$

144

### **Theorem PEEF** Properties of Extended Echelon Form Suppose that A is an $m \times n$ matrix and that N is its extended echelon form. Then

- 1. J is nonsingular.
- 2. B = JA.
- 3. If  $\mathbf{x} \in \mathbb{C}^n$  and  $\mathbf{y} \in \mathbb{C}^m$ , then  $A\mathbf{x} = \mathbf{y}$  if and only if  $B\mathbf{x} = J\mathbf{y}$ .
- 4. C is in reduced row-echelon form, has no zero rows and has r pivot columns.
- 5. L is in reduced row-echelon form, has no zero rows and has m r pivot columns.

### Theorem FS Four Subsets

Suppose A is an  $m \times n$  matrix with extended echelon form N. Suppose the reduced row-echelon form of A has r nonzero rows. Then C is the submatrix of N formed from the first r rows and the first n columns and L is the submatrix of N formed from the last m columns and the last m - r rows. Then

- 1. The null space of A is the null space of C,  $\mathcal{N}(A) = \mathcal{N}(C)$ .
- 2. The row space of A is the row space of C,  $\mathcal{R}(A) = \mathcal{R}(C)$ .
- 3. The column space of A is the null space of L,  $C(A) = \mathcal{N}(L)$ .
- 4. The left null space of A is the row space of L,  $\mathcal{L}(A) = \mathcal{R}(L)$ .

#### Definition VS Vector Space

Suppose that V is a set upon which we have defined two operations: (1) vector addition, which combines two elements of V and is denoted by "+", and (2) scalar multiplication, which combines a complex number with an element of V and is denoted by juxtaposition. Then V, along with the two operations, is a vector space over  $\mathbb{C}$  if the following ten properties hold.

- AC Additive Closure: If  $\mathbf{u}, \mathbf{v} \in V$ , then  $\mathbf{u} + \mathbf{v} \in V$ .
- SC Scalar Closure: If  $\alpha \in \mathbb{C}$  and  $\mathbf{u} \in V$ , then  $\alpha \mathbf{u} \in V$ .
- C Commutativity: If  $\mathbf{u}, \mathbf{v} \in V$ , then  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$ .
- AA Additive Associativity: If  $\mathbf{u}, \mathbf{v}, \mathbf{w} \in V$ , then  $\mathbf{u} + (\mathbf{v} + \mathbf{w}) = (\mathbf{u} + \mathbf{v}) + \mathbf{w}$ .
- Z Zero Vector: There is a vector,  $\mathbf{0}$ , called the zero vector, such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$  for all  $\mathbf{u} \in V$ .
- AI Additive Inverses: If  $\mathbf{u} \in V$ , then there exists a vector  $-\mathbf{u} \in V$  so that  $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$ .
- SMA Scalar Multiplication Associativity: If  $\alpha, \beta \in \mathbb{C}$  and  $\mathbf{u} \in V$ , then  $\alpha(\beta \mathbf{u}) = (\alpha \beta)\mathbf{u}$ .
- DVA Distributivity across Vector Addition: If  $\alpha \in \mathbb{C}$  and  $\mathbf{u}, \mathbf{v} \in V$ , then  $\alpha(\mathbf{u} + \mathbf{v}) = \alpha \mathbf{u} + \alpha \mathbf{v}$ .
- DSA Distributivity across Scalar Addition: If  $\alpha, \beta \in \mathbb{C}$  and  $\mathbf{u} \in V$ , then  $(\alpha + \beta)\mathbf{u} = \alpha \mathbf{u} + \beta \mathbf{u}$ .
- O One: If  $\mathbf{u} \in V$ , then  $1\mathbf{u} = \mathbf{u}$ .

The objects in V are called vectors, no matter what else they might really be, simply by virtue of being elements of a vector space.

## Theorem EMDRO Elementary Matrices Do Row Operations

Suppose that A is an  $m \times n$  matrix, and B is a matrix of the same size that is obtained from A by a single row operation (Definition RO). Then there is an elementary matrix of size m that will convert A to B via matrix multiplication on the left. More precisely,

- 1. If the row operation swaps rows i and j, then  $B = E_{i,j}A$ .
- 2. If the row operation multiplies row *i* by  $\alpha$ , then  $B = E_i(\alpha) A$ .
- 3. If the row operation multiplies row i by  $\alpha$  and adds the result to row j, then  $B = E_{i,j}(\alpha) A$ .
